

INDUCTIVE CHARGER

INDUCTIVE CHARGER

Features

Kar-Tech's inductive charger was designed to wirelessly charge your Kar-Tech radio transmitter. They're built for the MINI and MEGA series radio controls, and provide a full charge in four to eight hours. Moving up to inductive charging provides a more convenient way to charge, and prevents the operator from opening the transmitter at all – even to replace batteries. The inductive charger comes with our locator technology built in, too: if the remote is not in the charger when your ignition is turned on, a switch contact is closed that can supply an alarm or light. The inductive charger is shipped with a MEGA or MINI, two rechargeable batteries for the transmitter, and an AC adapter with an optional cigarette lighter adapter available. When you need to recharge your controllers' batteries, simply place the controllers on the charging pad where they lock on solidly due to strong magnets, and the sophisticated inductive charging system powers them up without any need for direct contact with the batteries. The charging pad features a built-in LED so you can see your controllers' charge status at a glance.

Specifications

Supply Voltage:	5 VDC
Charge Time:	4 - 8 hours.
Housing Material:	UL94 - HB High impact plastic
Locator Output:	.5 amp max
